

```
<div class="content">
  <div class="main-article">
    <div class="article">
      <h2>Article 1</h2>
      <div class="additional-info">
        <p>Details about additional info 1.</p>
      </div>
    </div>
    <div class="article">
      <h2>Article 2</h2>
      <div class="additional-info">
        <p>Details about additional info 2.</p>
      </div>
    </div>
  </div>
</div>
```

```
<div class="content">
  <div class="main-article">
    <div class="article">
      <h2>Article 1</h2>
      <div class="additional-info">
        <p>Details about additional info 1.</p>
      </div>
    </div>
    <div class="article">
      <h2>Article 2</h2>
      <div class="additional-info">
        <p>Details about additional info 2.</p>
      </div>
    </div>
  </div>
</div>
```

Both examples of code will give the same result, but the structure in the first image is proper.

If you open a `<div>` class use a tab or indentation to ensure the closing `</div>` tag aligns vertically with the open tag.

This approach helps to distinguish different sections and makes the code less prone to errors.

Write structural html code from next assignment onwards.
